

RENEWABLE IS DO-ABLE

A thousand years ago, how people used natural resources didn't matter very much. The human population of the Earth was very small, and it seemed impossible that something humans were doing could have any impact on the planet. But that has changed in the past 150 years, as the human population has grown to over 6 billion, and as we have

developed engines, electrical appliances and other devices that require energy to keep them operating. Today, humans demand more and more energy to live and to enjoy convenience and comfort; however, we are quickly depleting resources that cannot easily be replaced. Some of these non-renewable resources include petroleum, gasoline, diesel, natural gas, radioactive minerals and other minerals. Many scientists and business leaders are exploring ways to use renewable energy resources to replace non-renewables. Some of the most promising renewable energy resources include wind power, sun (solar) power, plants and trees (biomass), heat from the Earth's crust (geothermal), and even the motion of ocean waves and tides. It is more important than ever for all of us to conserve energy, to use renewable energy where we can, and to support those who are developing renewable energy technologies for the future technologies for the future.
